

BLOOD DONATION

Website Project

HTML • CSS • JavaScript • MySQL

Connecting donors with people in need through a simple, accessible and database-driven platform.

Presented by: _____

Department: Computer Engineering

Academic Year: 2026–2027

1. Project Overview

A digital platform designed to simplify blood donation and donor discovery.

The Blood Donation Website connects blood donors, patients and hospitals.

Users can register, log in and manage their donor information.

Blood groups and donor details are stored securely in a MySQL database.

The system reduces the time required to find a suitable blood donor.

The project demonstrates front-end development, client-side validation and database management.

2. Problem Statement

Challenges in traditional blood donor searching.

Difficulty finding donors with a specific blood group.

Dependence on phone calls, social media posts or manual records.

Lack of centralized and searchable donor information.

Delay during emergencies when time is critical.

Limited visibility of donor availability and contact details.

3. Objectives

What the project aims to achieve.

Create a user-friendly blood donation website.

Allow donors to register and maintain their profiles.

Enable users to search donors by blood group and location.

Store and retrieve information using MySQL.

Improve communication between donors and people requesting blood.

Promote awareness and encourage voluntary blood donation.

4. Technologies Used

Technology stack used to build the application.

HTML5

Page structure and semantic content

CSS3

Responsive layout, styling and visual design

JavaScript

Validation, dynamic actions and user interaction

MySQL

Database for donor and request records

5. Main Features

Core functionality of the website.

Home page with project information and call-to-action buttons.

Donor registration form with blood group and contact details.

Login and user authentication interface.

Search and filter donors according to blood group.

Blood request form for patients or hospitals.

Contact and awareness section.

Database storage and retrieval through MySQL.

6. System Workflow

How a user interacts with the platform.

Simple flow • Fast donor discovery • Better coordination

7. Database Design

Suggested MySQL tables for storing application data.

Table	Important Fields	Purpose
users	user_id, name, email, password	Login and account details
donors	donor_id, user_id, blood_group, city, phone	Donor information
blood_requests	request_id, patient_name, blood_group, hospital, status	Blood requirement records
contacts	contact_id, name, email, message	User enquiries and feedback

8. User Interface Screens

Insert screenshots of your actual website in this section.

9. Testing

Checks performed to improve reliability and usability.

Form validation: required fields, email format and valid blood group.

Login validation: correct and incorrect credentials.

Database testing: insert, update, search and retrieve records.

Search testing: blood group and location filters.

Responsive testing: desktop, tablet and mobile layouts.

Usability testing: clear navigation and readable content.

10. Benefits and Future Scope

How the project can be improved in future versions.

Faster access to donor information during emergencies.

Centralized record management and improved coordination.

Responsive design for access from different devices.

Future: SMS/email notifications for urgent blood requests.

Future: Admin dashboard for verifying donors and managing requests.

Future: Hospital integration, donor availability status and analytics.

Future: Location-based search and mobile application.

Thank You
